

Entity Relationship Diagram for a Grooming Salon Website

By Cheryl Rothlisberger

This is an entity relationship diagram for a database that allows customers to schedule grooming appointments for their pets through a public website. The customer should be able to make an account, input all of their contact information and information about their pets, such as breed, size, allergies, etc., view appointment information / history, including services, dates, notes, and the employee(s) that worked on their pet. They should be able to request a specific employee for their appointment and see what days they are available. It is also a tool for the manager of the business/website to be able to view/alter the schedule, customer accounts, services offered, invoices, and employee availability. They should be able to send out appointment reminders to customers who have subscribed to it, as well as invoices for services rendered.

See Use Case Diagram and Database List Outline for more information.
